1. Introduction

FPDS currently provides Atom Feeds to users wishing to pull contract data in a contract writing or other systems. This service is aimed primarily at federal systems, though it is available for anyone.

SAM will replace and enhance the FPDS Atom Feed with a RESTful API. This API will provide the same role of serving federal systems with contract data.

This document will outline the critical differences in schema and approach between the FPDS Atom Feed and the SAM Contract API to help bridge the gap in testing and provide direction for downstream system consumers.

2. High-Level Differences

	FPDS Web Service	**SAM Contract API**
Protocol	SOAP	REST
Format	XML	JSON
Authentication	Username / Password	API Key
Roles	• Public • Government (Civilian) • Government (DoD) • System	• Public • FOUO (Civilian) • FOUO (DoD) • System
Access Control	Role tied to FPDS account	• Role tied to SAM account • IP address whitelisting (System Account)
Request Schema Approach	Request parameters to allow for request construction	Currently supported request parameters and new parameters to allow for additional customized requests.
Response Schema Approach	All contract data provided based on role	All contract data provided based on role

3. FPDS Atom Feed vs SAM Contract API Request Differences

The FPDS Atom Feed request parameters below have been deprecated and are not supported by the SAM Contract Data API:

1. DESCRIPTION_OF_REQUIREMENT
2. CONTRACTING_OFFICE_NAME
3. FUNDING_OFFICE_NAME

For a full list of the SAM Contract Data API parameters, view the GitHub site available here: https://open.gsa.gov/api/contract-awards/.

4. FPDS Atom Feed vs SAM Contract Data API Response Differences

Response Structure

The response structures for both FPDS Atom Feed and SAM Contract Data API are different, with the introduction of the core and contract section. In addition to reorganizing the response, there are changes to the naming convention used for certain data elements. The below table

provides a one to one mapping for data elements which have had a name change:

Codes and Descriptions

FPDS web services and Atom Feeds use SOAP/XML Structure**.** In the FPDS SOAP-based implementation, certain data elements were returned as XML elements where the **value** represented a **code**, and the **descriptive name** was provided as an **attribute** of the element.

Ex.

<ns1:countryOfOrigin name="UNITED STATES">USA</ns1:countryOfOrigin>

<ns1:contractActionType description="DEFINITIVE CONTRACT">D</ns1:contractActionType>

- "USA" and "D" are the **code** (element value)
- "UNITED STATES" and "DEFINITIVE CONTRACT" are the **name/label** (element attribute)

In the JSON-based implementation, these same data elements are now expressed as **JSON objects** containing **explicit key-value pairs** for both the code and the name.
Ex.

```
"countryOfOrigin": {
        "code": "USA",
```

```
            "name": "UNITED STATES"
          }
"contractActionType": {
          "code": "D",
          "name": "DEFINITIVE CONTRACT"
        },
```

- "code" holds the same value previously returned as the XML element's text.
- "name" holds the descriptive label previously included as an XML attribute.
